

Unseen Dangers

Biology often deals with very small things, too small to be seen by the naked eye. Germs such as bacteria are miniscule when compared to humans. Germs are microbes that can harm humans. Good hand washing can remove most of the harmful germs. To explain this further an activity was conducted for the grade IV Students where it was shown through an experiment that how microbes can easily be transferred from one person to another. The experiment further explained them that even after washing hands areas can be detected where germs can be seen with the UV pens. Therefore they were taught to wash hands thoroughly. It was quiet and informative experiment conducted for the vivians to learn how important it is to wash hands thoroughly.
